

EPA Helping Communities Manage Electronic Waste

Cell phones, televisions, laptops, tablets, watches - there is always something shinier, newer, faster, and smarter to choose from in the world of electronic devices. Americans currently own more than 3 billion electronic products. The average American has 24 devices per household. As the use of these electronic products has grown, the average lifespan of these products becomes shorter. This in turn has resulted in increased volume of discarded and obsolete electronic devices. The resulting waste, commonly known as "e-waste," is the fastest-growing component of the municipal waste stream in the United States. According to the Global E-Waste Monitor (2017) this has become an emerging problem worldwide, with an estimated 40 million tons of e-waste being generated every year, with less than 30 percent being recycled. The remaining e-waste materials are discarded in landfills or incinerated. Recovering materials from this waste stream poses challenges. "Management of the electronic waste is related to composition," said EPA researcher John Glaser. "Separating different items or assemblages should occur early in the recycling pathway. Generally, much more complex mixtures of e-waste materials lead to a situation where material recovery is very limited."

To help understand and improve the flow of used electronics products from consumer markets to the waste or reuse stream, EPA researchers have developed the Alternative Disposition of Electronics Planning Tool, also called ADEPT.

ADEPT is a modeling tool that uses electronics purchasing data to estimate the composition and quantity of electronic materials designated as waste or reuse. The tool tracks the generation of ewaste on an annual basis for each state and estimates the material flow from end-of-use to disposal. This method uses a market supply method to calculate the amount of e-waste that will be generated,

reused, recycled, exported, and disposed of in landfills. E-waste products may contain valuable materials, such as gold, copper and nickel, and rare materials of strategic value such as indium and palladium. Many of these materials can be recovered and reused, while hazardous materials in e-waste, such as mercury, lead, and brominated flame retardants, may require special disposal.

"The simpler the composition of recycling materials, the easier the task of recycling," explained Glaser. "Separating items may take additional time and money and may be avoided by a recycling company in search of a profit." ADEPT can be used to make predictions of future waste generation demands and to evaluate different disposal scenarios of used electronics at both state and national levels. It can also be a useful tool for states to understand how much and what type of e-waste is being generated in their state. This information can be used to improve existing recycling programs.

"ADEPT was designed to be a flexible tool that can be valuable to many users," said Glaser. "The utility of ADEPT extends from state regulators to interested people in our communities." In the hands of state officials and manufacturers, ADEPT can be used to measure the value of current state takeback programs. Many electronics companies and retailers have voluntary takeback programs where they offer takeback and recycling options for e-waste even in states where there is no law requiring it. Manufactures who participate in the takeback program can use ADEPT to estimate the composition of current and future year's material in the state takeback program. If done properly, the United States can increase its domestic recycling efforts, reduce harm from exports of E-Waste, strengthen domestic and international markets for viable and functional used electronic products, and prevent health and environmental threats from e-waste. Sticky Situation

By John E. Weare Keep Alliance Beautiful

Giant bees painted on pavement in Alliance catch drivers' eyes. A giant hive at an Omaha Catholic school meant plenty of honey and thousands of re-homed insects.

My honey bee connection comes from a story told by Eric Krakowski, assistant principal, at Duchesne Academy of the Sacred Heart, during the recent 2021 Keep Nebraska Beautiful (KNB) Conference in Lincoln. During a project, workers found a one- by eight-foot honeybee hive that had been growing for years under the exterior of a building. He explained the school took measures to relocate all 50,000 bees to midtown Omaha hives and processed the honeycomb. Their unexpected task benefitted from the principal's beekeeping hobby. Speaking on "Sustainability in Our Schools," Krakowski said one of their goals is to have bee hives on the roof. Sustainability includes everything from recycling to energy efficiency with a different approach by any given school district in Nebraska. Looking at our Bulldog Green, for example, Alliance High School is a bit larger than the 450 people on campus at Duchesne. And, realistically, I cannot compare the two (east vs. west, public vs. private, etc.) beyond size. Instead, the takeaway for me was to consider what this all-girls school continues to accomplish after addressing sustainability to its mission and curriculum.

Schools putting sustainability near the top of the list often have a catalyst, perhaps a teacher or administrator willing to spearhead the effort. Maybe the new practices help finances stay in the black. At Duchesne, Krakowski recalled, the school responded to Pope Francis' encyclical -- "Laudato Si' on care for our common home" in 2015. An anonymous donor (paying half) helped underwrite the plan to respond to the pope's message on the environment, he said. A survey the next year returned at 94 percent saying what the school hoped to do was "important or very important." "That was very encouraging," Krakowski said.

Over the past five years Duchesne has been working to meet four goals:

- Zero waste by 2030
- Net positive energy by 2030
- Sustainable food system
- Sustainability curriculum

Krakowski highlighted practices, projects and data concerning each goal. Staff performed an initial waste audit that has been repeated every six months.Calling what they started with a "piecemeal recycling program," Krakoski showed how improved recycling and composting helped reduce waste. Students and staff had been producing 15 cubic yards of waste before compared to six or seven, sometimes less, now. Leftovers from the vegetarian lunch program go to a commercial composting site. No styrofoam or plastic is used in the cafeteria either.

The building itself -- more than a century old -- has been retrofitted to be more environmentally friendly. Krakowski said the school has been Energy Star certified since 2016. "Only eight percent of certified buildings are more efficient," he added. Two years ago they added 30 solar panels on the library roof meant to offset the power demands of the STEAM lab. The array has met or exceeded the objective.

Though the presentation included a number of other environmental activities, Krakowski concluded with practical advice. Schools or communities leery of making sustainability a priority should consider this sampling of the assistant principal's suggestions: Start with you; start simple, create a plan; empower others; and it's okay to make mistakes. Communicate

Let your friends and family know what you're doing and help them get involved. Write letters to companies that over-package and tell them you're concerned about this issue. You'll be surprised how powerful leading by example can be!
